

## UNDERSTANDING PERIODONTAL (GUM) DISEASE

Periodontal diseases occur when a bacterial infection develops where the gums join the teeth. Harmful bacteria release enzymes that can cause underlying bone loss, receding gums and eventual tooth loss.

## PERIODONTAL DISEASES

- #1 cause of tooth loss in adults
- Affect more than half of people over age 30
- Often painless and may go undetected
- May be genetic and inherited

Bacteria associated with periodontal diseases can travel into the bloodstream and may result in other adverse health effects. This makes early detection of periodontal diseases critical.
